

Memory Bound Computing

Francesc Alted

Freelance Consultant & Trainer

<http://www.blosc.org/professional-services.html>

PySS 16

Donostia, Basque Country, Spain

October, 2016

Goals

- Recognize when your computation is memory bounded, not CPU-bounded
- Learn techniques that helps you getting more performance for memory-bound problems
- Learn to use existing packages for tackling these problems

Let's Start with Some Exercises

Within the computing machine, clone the repo at:

<https://github.com/FrancescAlted/MemoryBoundComputations>

and start doing exercises 0 to 3 (inclusive)

“Across the industry, today’s chips are largely able to execute code faster than we can feed them with instructions and data.”

– Richard Sites, after his article
“It’s The Memory, Stupid!”,
Microprocessor Report, 10(10), 1996

The Starving CPU Problem

Memory Access Time vs CPU Cycle Time

The gap is wide and still opening!

Book in
2009

The Status of CPU Starvation in 2016

- Memory latency is much slower (between 250x and 1000x) than processors.
- Memory bandwidth is improving at a better rate than memory latency, but it is also slower than processors (between 30x and 100x).

CPU Caches to the Rescue

- CPU cache latency and throughput are much better than memory
- However: the faster they run the smaller they must be (because of heat dissipation problems)

Computer Architecture Evolution

Up to end 80's

90's and 2000's

2010's

When CPU Caches Are Effective?

Mainly in a couple of scenarios:

- Time locality: when the dataset is reused
- Spatial locality: when the dataset is accessed sequentially

Time Locality

Parts of the dataset are reused

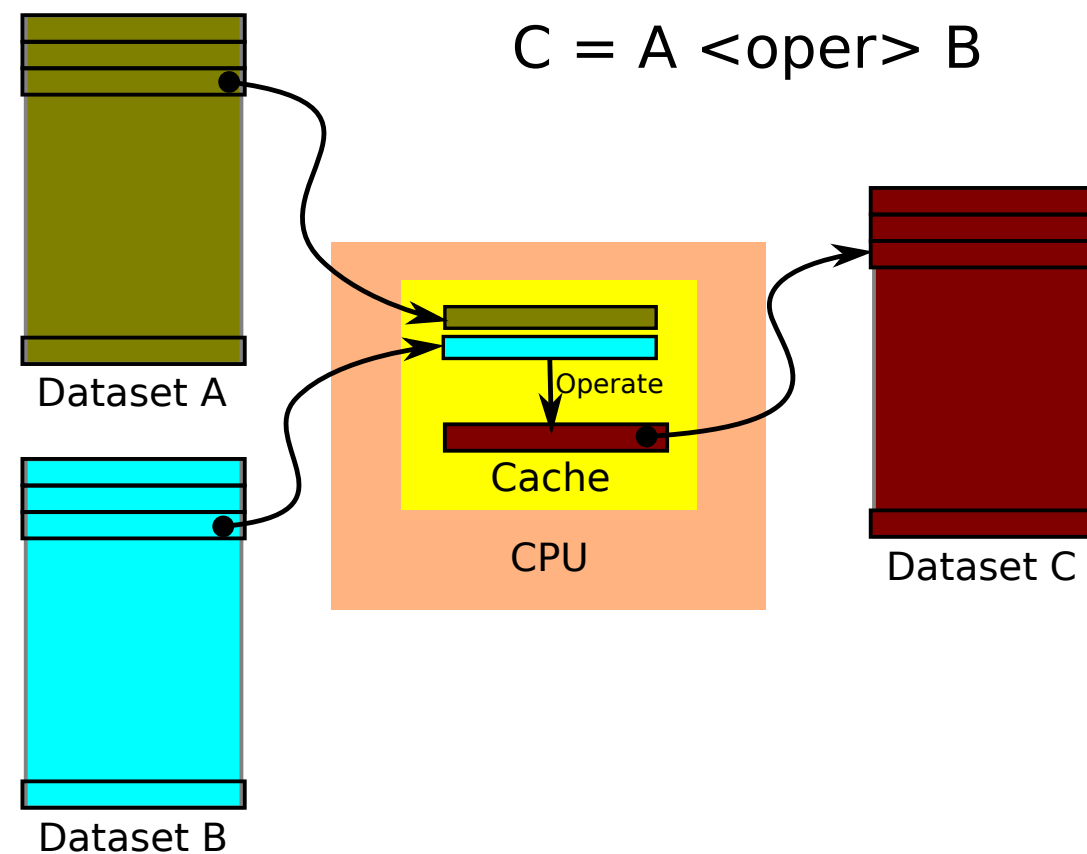

Spatial Locality

Dataset is accessed sequentially

The Blocking Technique

When accessing disk or memory, get a **contiguous** block that fits in CPU cache, operate upon it and **reuse** it as much as possible.

Use this extensively to leverage **spatial** and **temporal** localities

The Blocking Technique in Action (Exercise 0)

CPU: Intel Xeon E312xx @ 2.00GHz (Sandy Bridge)

The Blocking Technique in Action (Exercise 0)

CPU: Intel Xeon(R) CPU E3-1245 v5 @ 3.50GHz (Skylake)

Trends in Computer Architecture

We Are In A Multicore Age

- This requires special programming measures to leverage all its potential: threads, multiprocessing

SIMD: Single Instruction, Multiple Data

More operations in the same CPU clock

Forthcoming Trends in CPU

More Cores

Wider Vectors

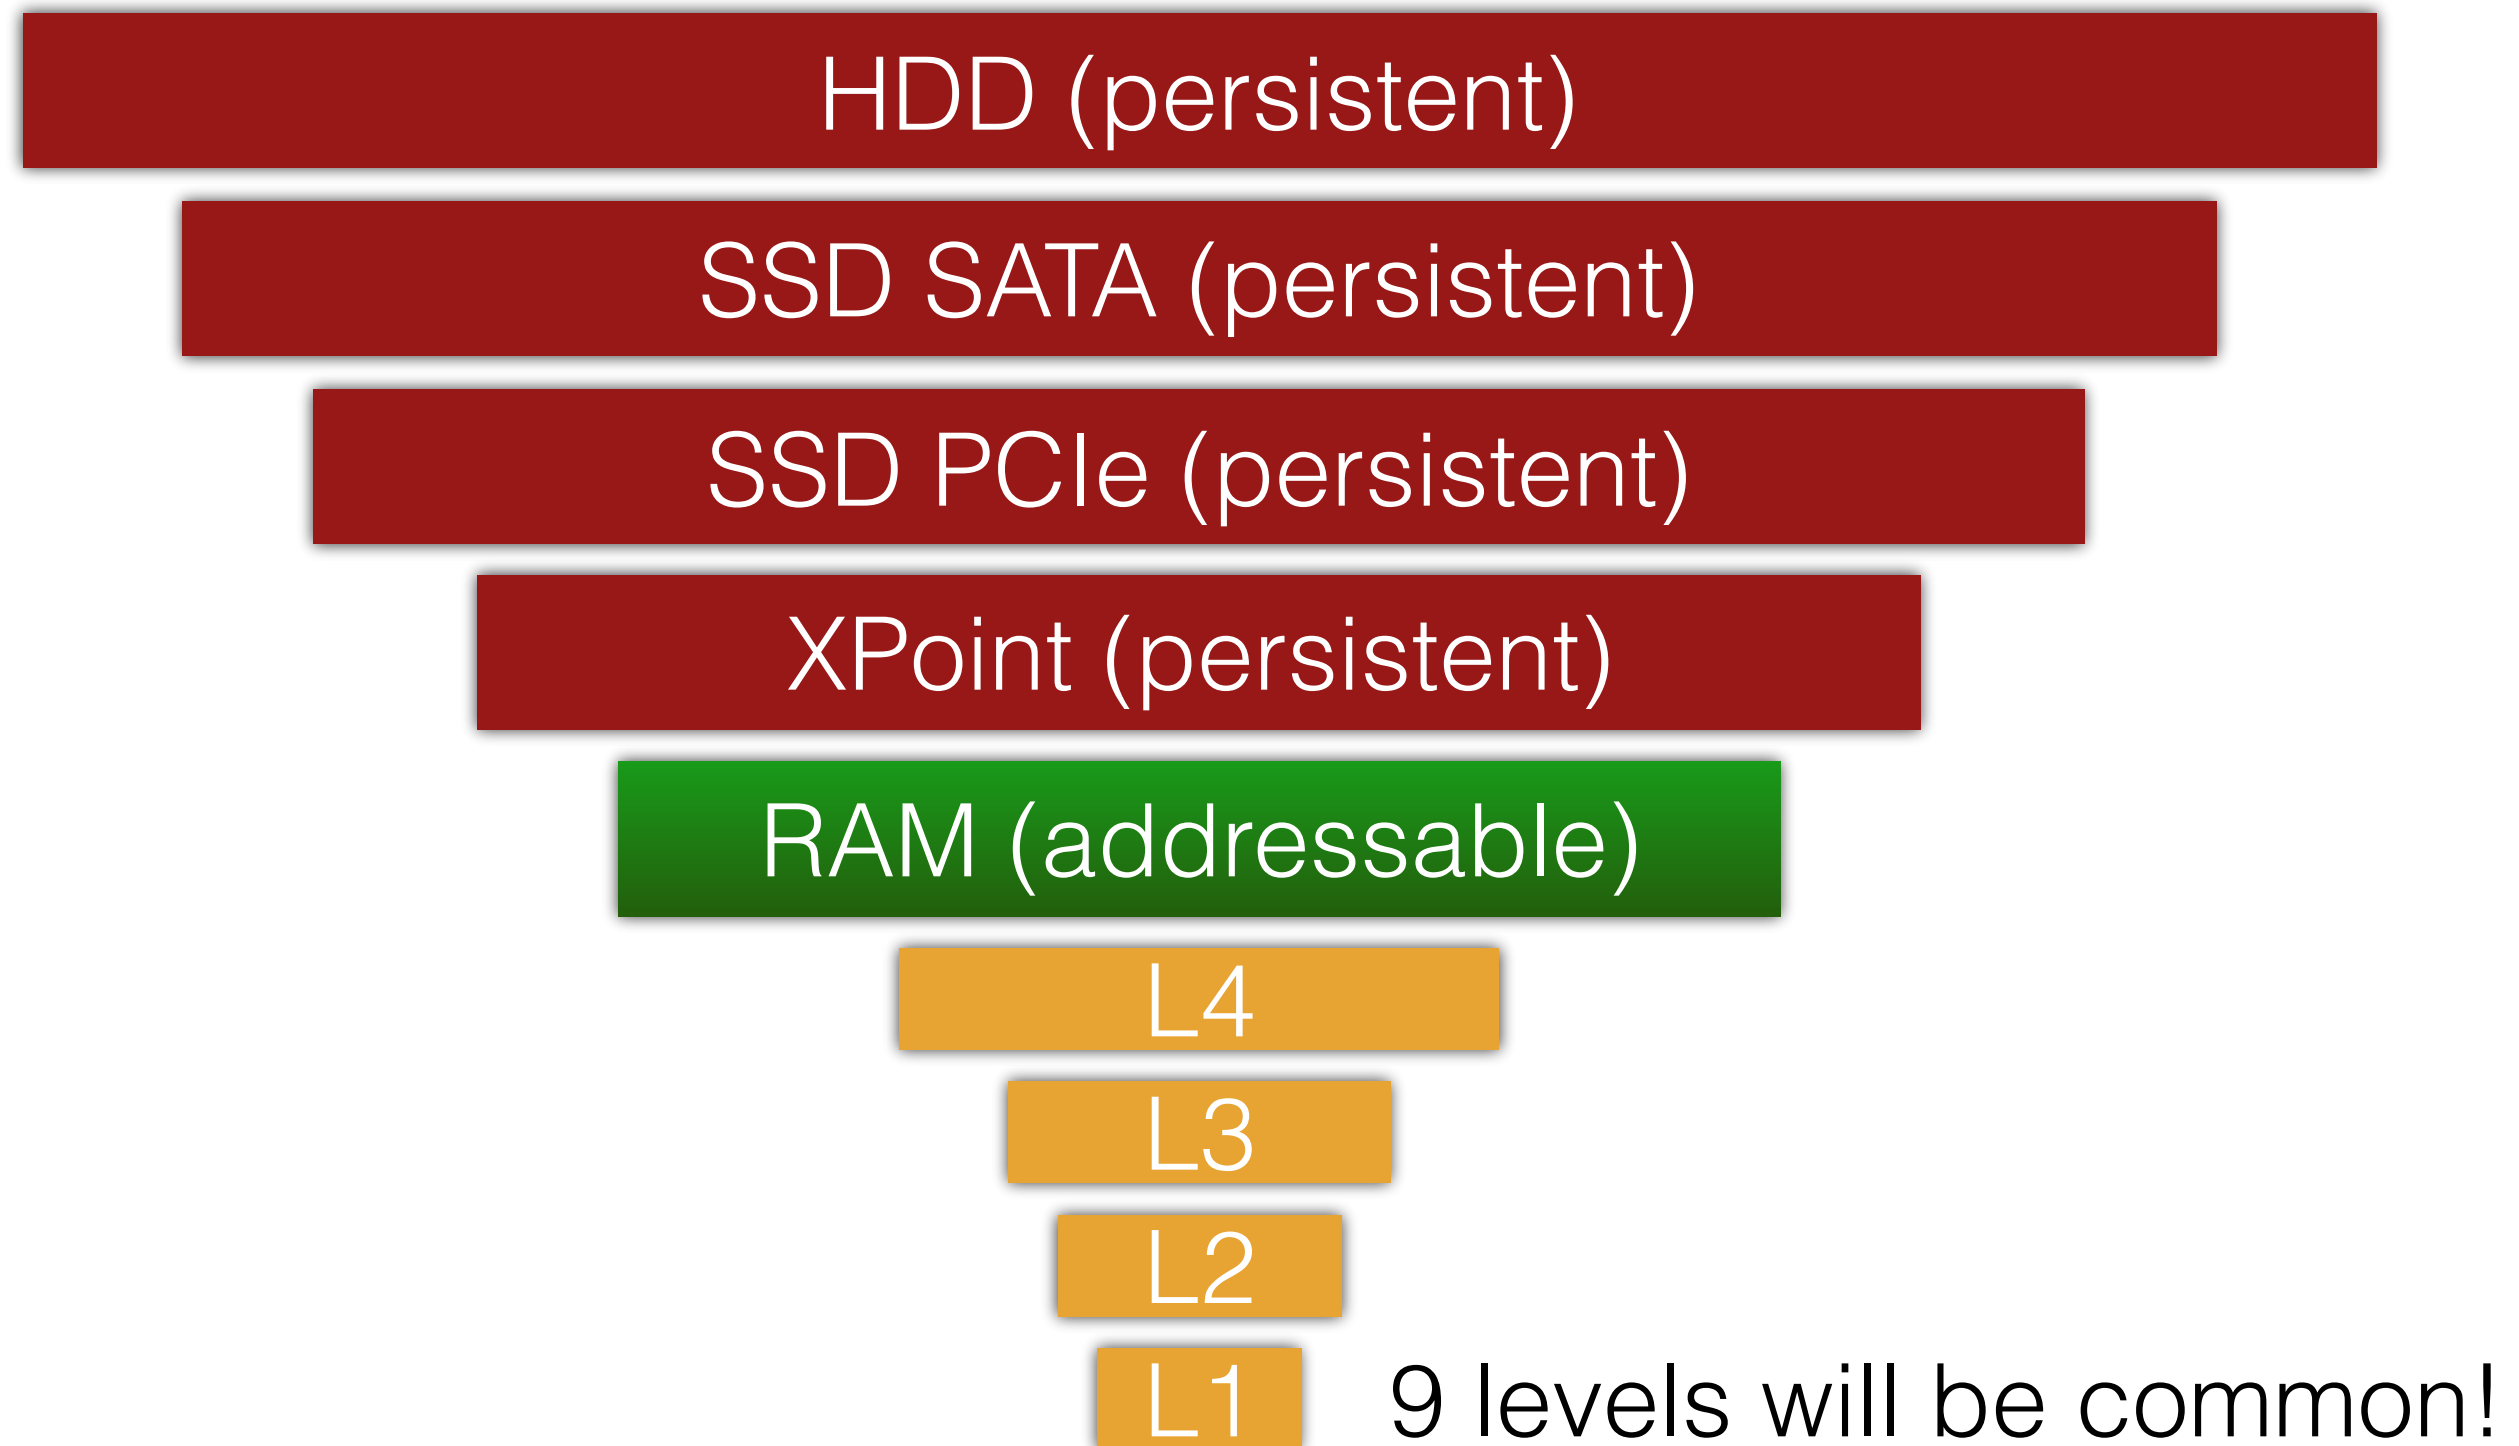

CPU+GPU Integration

Hierarchy of Memory

By 2018 (Educated Guess)

numexpr

- It is a computational engine for NumPy that makes a sensible use of the memory hierarchy for better performance
- It can use multi-core (via multi-threading) and SIMD (via Intel's MKL) for better CPU usage.
- PyTables, pandas and bcolz (among others) can all leverage numexpr automatically if installed

Computing with numexpr

Power Expansion

Numexpr expands expression:

$0.25*x3 + 0.75*x**2 + 1.5*x - 2$**

to:

$0.25*x*x*x + 0.75*x*x + 1.5*x - 2$

so, no need to use the expensive `pow()`

Computing with NumPy

Temporaries go to memory

Computing with numexpr

Temporaries stay in cache

Multithreaded numexpr and Beyond: Numba

numexpr Allows Multithreading for Free

numexpr with 16 (logical) cores

Memory bounded!

Transcendental Functions

numexpr with 16 (logical) cores

CPU bounded!

Numexpr Limitations

- Numexpr only implements element-wise operations, i.e. '**a*b**' is evaluated as:

```
for i in range(N):
```

```
    c[i] = a[i] * b[i]
```

- In particular, it cannot deal with things like:

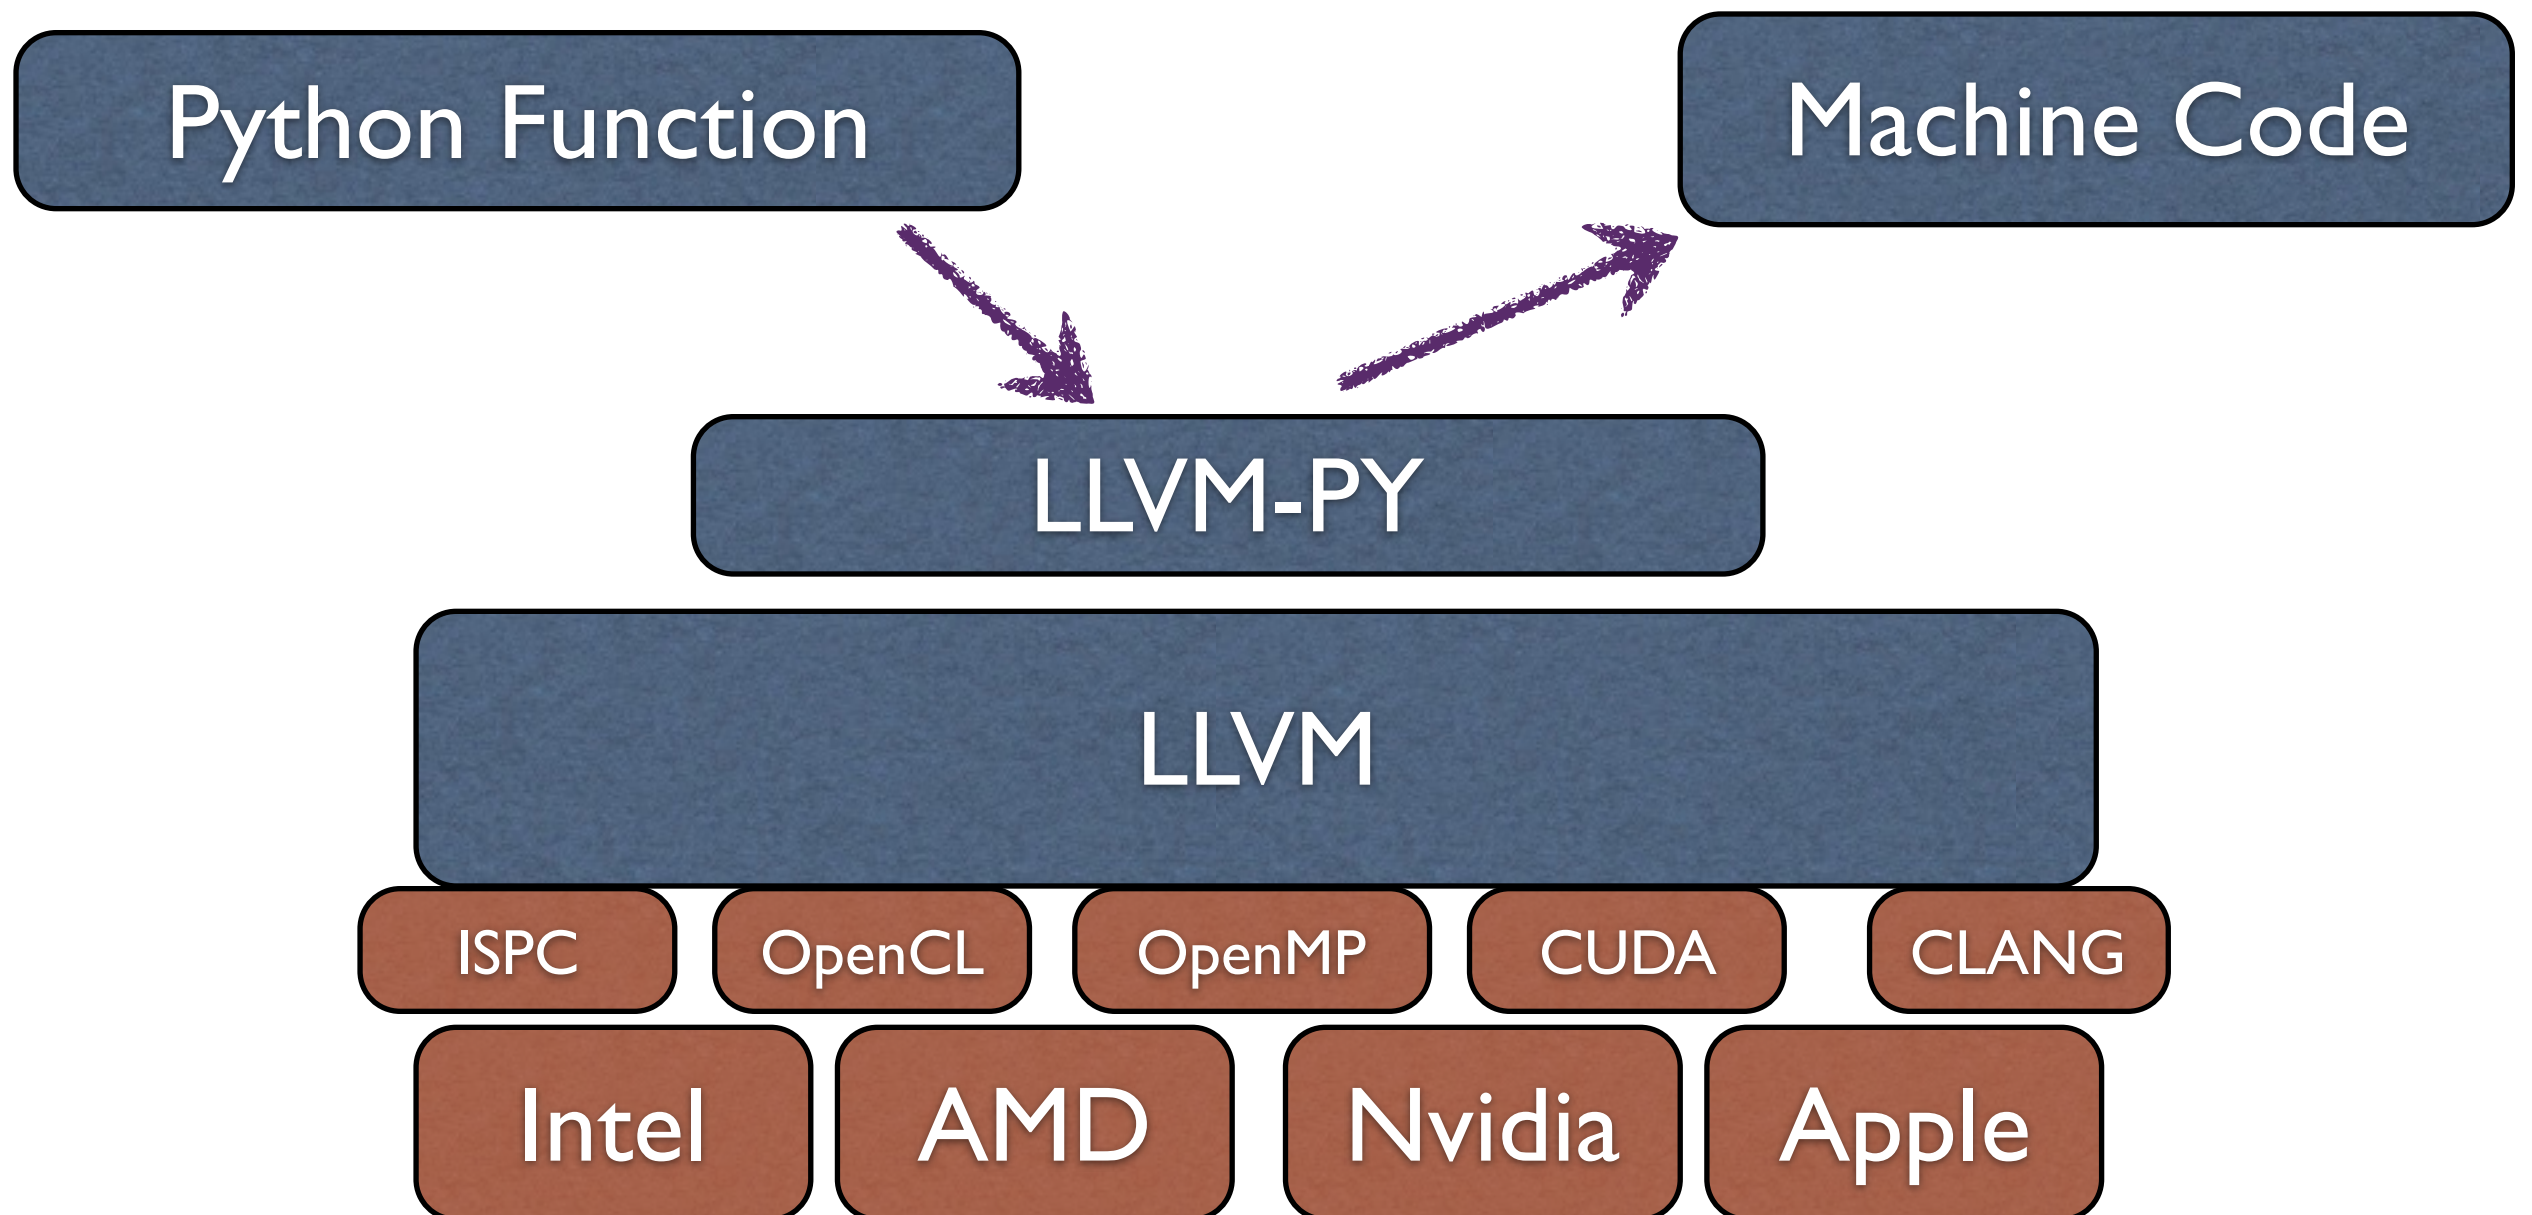

```
for i in range(N):
```

```
    c[i] = a[i-1] + a[i] * b[i]
```

Numba: Overcoming numexpr Limitations

- Numba is a JIT that can translate a subset of the Python language into machine code
- It uses LLVM infrastructure behind the scenes
- Can achieve similar or better performance than numexpr, but with more flexibility

How Numba works

Take-away Messages

- When you have to optimize, have in mind the starving CPU problem.
- Do not always try to parallelize blindly. Give (memory) optimization a try first.
- Use proper tools when you need speed. Using one single tool for everything is not going to work well.

Eskerrik asko!
